# Task 1 - Web App QA & Debug Report

Candidate: Mohaddis YSM | Target: RealWorld Vue example | Updated: 11 November 2026

Verification status: Candidate reports manually checking all five findings and observing the problems. This statement is based on the candidate's account; no browser logs or independent recordings of the five reproductions were supplied. The six full end-to-end user journeys are not separately documented.

## Bug / QA finding table

| # | Finding | How to reproduce | Expected vs. candidate-reported observation | Severity | Likely cause |
|---|---|---|---|---|---|
| **1** | Sign-up email has no format validation | Visit /register. Type not-an-email into Email, provide otherwise valid details, and submit. | Expected: malformed email blocked in the form. Reported: malformed address was not prevented by frontend validation. API rejection/acceptance was not recorded. | Medium | Register.vue email input is type=text; no local email-format check. |
| **2** | Empty registration not blocked locally | Visit /register. Leave username, email, password blank, then submit. | Expected: clear required-field messages before API call. Reported: form lacks client-side required-field prevention. Exact server response not recorded. | Medium | Missing required attributes and submission guard. |
| **3** | Fields lack persistent accessible labels | Inspect fields on /register, /login and /settings; review their HTML labels/accessibility names. | Expected: inputs have accessible associated labels. Reported: placeholder-only fields with no persistent labels. Screen-reader result not recorded. | High | Login, Register, Settings templates rely on placeholders. |
| **4** | Sign-up can be submitted repeatedly | Enter valid sign-up data, slow network, click Sign up twice rapidly; inspect requests. | Expected: a pending submission prevents repeat clicks. Reported: no button disabled/loading guard. The exact number of network requests was not recorded. | Medium | No isSubmitting protection around async submit. |
| **5** | Settings email lacks format validation | Sign in, open /settings, change Email to bad-address, click Update Settings. | Expected: invalid email flagged before save. Reported: frontend does not validate format before submitting. Backend result not recorded. | Medium | Settings.vue email is type=text with no email check. |

## Root-cause analysis - Finding 1

In the registration form, the email field is implemented as a general text input instead of an email-specific input. The form does not include a visible validation check before submission. Its handler passes the entered value to the authentication flow without first checking whether the address is correctly formatted. This means invalid-looking addresses may reach the API, creating unnecessary requests and forcing users to depend on server errors. The likely root cause is an incomplete frontend validation implementation; whether the backend accepts invalid addresses is not established by the available evidence. I would change the input to an email field, mark required inputs appropriately, and display clear inline messages before submission. I would retain server-side validation and test empty, malformed, and valid addresses.

## Test scope and evidence

The candidate reported confirming the five issues through manual checks. The report does not claim network captures, screen-reader testing, exact backend responses, or a recorded end-to-end pass across signup, login, article creation, editing, deletion, and logout. Screenshots of bug reproduction are optional under the assessment.
